# Intro: Greatest Common Divisors II

Daniel Kane

Department of Computer Science and Engineering University of California, San Diego

## Data Structures and Algorithms Algorithmic Toolbox

## Learning Objectives

- Implement the Euclidean Algorithm.
- Approximate the runtime.

#### **GCDs**

#### Definition

For integers, a and b, their greatest common divisor or gcd(a, b) is the largest integer d so that d divides both a and b.

## **GCDs**

#### Definition

For integers, a and b, their greatest common divisor or gcd(a, b) is the largest integer d so that d divides both a and b.

### Compute GCD

Input: Integers  $a, b \ge 0$ .

Output: gcd(a, b).

## Key Lemma

#### Lemma

Let a' be the remainder when a is divided by b, then

$$\gcd(a,b)=\gcd(a',b)=\gcd(b,a').$$

## Proof

## Proof (sketch)

- $\mathbf{a} = \mathbf{a}' + \mathbf{b}\mathbf{q}$  for some  $\mathbf{q}$
- d divides a and b if and only if it divides
   a' and b

## Euclidean Algorithm

## Function EuclidGCD(a, b) if b = 0:

return a  $a' \leftarrow$  the remainder when a is divided by breturn EuclidGCD(b, a')

## Euclidean Algorithm

## Function EuclidGCD(a, b)

if b = 0:
 return a  $a' \leftarrow$  the remainder when a is
 divided by b
return EuclidGCD(b, a')

Produces correct result by Lemma.

gcd(3918848, 1653264)

```
gcd(3918848, 1653264)
= gcd(1653264, 612320)
= gcd(612320, 428624)
```

```
gcd(3918848, 1653264)
= gcd(1653264, 612320)
= gcd(612320, 428624)
= gcd(428624, 183696)
```

```
gcd(3918848, 1653264)
= gcd(1653264, 612320)
= gcd(612320, 428624)
= gcd(428624, 183696)
= gcd(183696, 61232)
```

```
gcd(3918848, 1653264)
= \gcd(1653264, 612320)
= \gcd(612320, 428624)
= \gcd(428624, 183696)
= \gcd(183696, 61232)
= \gcd(61232, 0)
```

```
gcd(3918848, 1653264)
= \gcd(1653264, 612320)
= \gcd(612320, 428624)
= \gcd(428624, 183696)
= \gcd(183696, 61232)
= \gcd(61232, 0)
=61232.
```

#### Runtime

- Each step reduces the size of numbers by about a factor of 2.
- Takes about log(ab) steps.

#### Runtime

- Each step reduces the size of numbers by about a factor of 2.
- Takes about log(ab) steps.
- GCDs of 100 digit numbers takes about 600 steps.
- Each step a single division.

#### Summary

- Naive algorithm is too slow.
- The correct algorithm is much better.
- Finding the correct algorithm requires knowing something interesting about the problem.
